

Technology Solutions Proposal

Custom Software, AI & Automation for Your Business

AUREVIXA TECHNOLOGIES

Custom Software | AI | Automation | Integrations | Cloud

Technology built around your business.

Who We Are

Custom-built technology for real business needs.

We design and build custom digital solutions based on how your business actually works. Instead of forcing your team into a generic system, we first understand your processes, pain points, users, and goals - then we design the right solution around them.

Our role

From a simple website to a complete internal platform, mobile app, AI assistant, or automated workflow, we can take the project from discovery through deployment and ongoing support.

What We Can Build

Custom Software	Web applications, internal systems, CRM, portals, dashboards, SaaS platforms and operational tools.
Websites & E-Commerce	Corporate websites, landing pages, online stores, booking sites, membership platforms and self-service experiences.
Mobile Applications	Customer, employee, field-service, delivery, booking, sales, inventory and internal mobile apps.
AI Solutions	AI chatbots, voice agents, knowledge assistants, document processing, enterprise search and AI copilots.
Automation	Workflow automation, customer follow-ups, approvals, onboarding, reporting, notifications and repetitive back-office tasks.
Integrations & APIs	Connect CRM, ERP, accounting, payment, e-commerce, email, calendar, cloud storage, messaging and other systems.
Data & Dashboards	Databases, reporting dashboards, data migration, synchronization, pipelines and business intelligence.
Cloud & Support	Deployment, monitoring, maintenance, performance improvement, security updates and ongoing enhancements.

Typical Problems We Help Solve

Common areas where custom technology can remove friction.

- Too much manual encoding or repetitive admin work
- Business processes spread across spreadsheets, email and chat
- Existing systems that do not communicate with each other
- Slow customer response and follow-up
- Difficulty tracking projects, customers, orders, applications or requests
- Manual report preparation and limited real-time visibility
- Legacy software that is difficult to use or scale
- A new product idea that needs to become a working MVP

How We Work

1	Discover We understand your current process, goals, users and constraints.
2	Design We define the solution, workflow, interface, architecture and integrations.
3	Build We develop the system in clear stages and keep the project aligned with agreed requirements.
4	Test We perform quality assurance and client acceptance testing.
5	Launch We deploy the approved solution and support rollout.
6	Improve We can continue maintaining, automating and expanding the system as your business grows.

Flexible Engagement Options

Choose the model that best matches the stage and scope of the work.

Fixed Project	Best when the scope and deliverables are clearly defined.
MVP / Proof of Concept	Best for validating a new product, workflow or AI use case before a larger investment.
Monthly Retainer	Best for continuous development, automation, support and feature improvements.
Dedicated Team	Best for organizations that need ongoing engineering capacity without building a full internal team.
Maintenance & Support	Best for systems that need monitoring, fixes, upgrades and incremental enhancements after launch.

Why Work With Us

- Solutions are designed around your process, not around a pre-built template.
- We can combine software, AI, automation, integrations and cloud infrastructure in one solution.
- We focus on practical business outcomes such as faster processing, fewer manual tasks and better visibility.
- Systems are designed with scalability, usability and maintainability in mind.
- We can support the full lifecycle: discovery, design, development, testing, deployment and continuous improvement.

Example: From Manual Workflow to Automated System

A practical illustration of what a redesigned process can look like.

A team currently receives requests through email, manually enters information into spreadsheets, assigns work through chat, follows up with customers, and prepares reports by hand.

A redesigned automated flow

Request received	Information captured	Task created	Owner assigned
Customer notified	Status tracked	Dashboard updated	Report generated

The exact solution may be a web application, workflow automation, AI agent, system integration, or a combination of these. We select the technology based on the business problem.

Next Step

The best starting point is a discovery discussion where we review your current workflow, pain points, desired outcome, users, existing systems, and priorities. From there, we can prepare a recommended solution, project scope, estimated timeline, and commercial proposal.

LET US BUILD AROUND YOUR BUSINESS

Tell us the problem you want to solve. We will help design the technology that solves it.
